

HTML & CSS  
→ <div> tag.

Day 3

<div> </div>

no use

↓

change it to  
important using  
CSS

CSS

what is CSS?

It is used to style your respective web page.

Types of CSS → 3

- ✓ 1). Inline → written
- ✓ 2). Internal → written
- ✓ 3). External → It is

written the tag  
within the page

written separately.

↳ <link>

Selectors → \*

→ class → .

→ id → #

→ Tag (element) → Tag

→ Universal → \*

. link {

text-decoration : none.

}  
~~#~~ style { }

<a href = " " class = "link style">

<div> </div>

div {

height : 100px

width : 100px;

win

}

styling priorities

→ ① internal → Priority 2

② inline → Priority 1

→ ① external → Priority 2

② inline → Priority 1

→ ① internal → } No priority unless  
② external → } we see the codebase

→ <link type="stylesheet" href="external.css">

<style>

</style>

<link

type="stylesheet"  
href="external.css">

<style>

style

① internal: Priority 2

2177

- ① internal : Priority 1
- ② external : Priority 2

② external : Priority 1

① internal : Priority 3.

② external : Priority 2

③ inline : Priority 1

- ① internal : Priority 2
- ② external : Priority 3
- ③ inline : Priority 1

Intermediate CSS

Box Model

General term : Frontend ✓  
Precise term : Information / Content ✓

① Is your padding coming towards your content or outwards? outwards.

~~Box Model~~ → Content will not move  
padding: 10 px → Outwards

② Margin: 5 px → Towards your Content  
③ Border: 5 px solid grey → Towards your Content

## Positioning

- ① relative ✓
- ② absolute ✓
- ③ fixed ✓

③ fixed

position: Fixed  $\Rightarrow$  It is going to fix the position of the content.

position: relative  $\Rightarrow$

position: absolute  $\Rightarrow$  Can't be worked independently.  
This absolute is dependent on your relative position.
